

Basic use cases:

User should be able to create, read, update and delete their tasks after logging in. The tasks should have 4 parameters: title, to-do date, due date and whether it is completed.

My execution plan will be according to the below list. One biggest problem I face right now is implementing a user authentication method and it has taken up quite a bit of time.

Current problems/features to implement:

- Completing CRUD feature
- Adding an authentication method to separate user database
- Tagging system to sort tasks
- Moving completed tasks to a different table
- Hosting on Heroku
